

Tool designed for securing products with PP and PET strapping by tensioning the strapping around parcels, packages or goods stacked on wooden pallets.

It uses the most advanced and exclusive brushless motor technology for greater durability and to minimise maintenance work. It also has a special and unique design with the lower gripping plate on the tensioning wheel offering maximum performance in situations that call for high-tension strapping.

With automatic tensioning, the device can be used with just one hand and the automatically selected tension is applied with just a brief press of the button, with no need to hold it down for a long time.

For fragile packages or for low-tension strapping, it has a SOFT option which will automatically adjust the tension to ensure no damage is caused to the packaged goods.

Its latest generation Li-ion battery (18 V and 3.0 mAh) offers numerous benefits such as no memory effect (loss of capacity), more strapping applied per charge and no charge lost over time, among many others.
