

Drying salts are the best drying agent on the market, thanks to their enhanced absorption capacity and their properties which keep them completely dry and with no physical changes even when fully saturated. This type of bag prevents the circulation of humidity by absorbing and neutralising any trace of moisture inside packaging.

As for the drying salts **Absorpole**, **Absorbag**, **Absorgel** and **Absortop**, they are ideal for absorbing humidity and condensation inside containers. They are especially recommended for protecting cargo against corrosion, mould and any kind of imperfection caused by a constant excess of humidity.
